

## Space Invaders CSS Challenge

**Objective:** Your mission is to bring a squadron of Space Invaders to life using only HTML and CSS. Utilize your skills in CSS positioning, pseudo-elements, and animations to create a captivating scene of floating invaders against a starry sky.

### Requirements:

1. **Setup Your Battlefield:** Create a single HTML file that will contain all your markup and styling. Set the stage with a dark, starry background.
2. **Summon Your Invaders:** Each Space Invader should be represented by a single `div` element. Inside this div, another div will serve as the invader's eyes. Style these elements to resemble the iconic Space Invader.
3. **Mobilize the Fleet:** Arrange multiple invaders in formation. Use a container to group them together, and apply flexbox properties to space them evenly.
4. **Bring Them to Life:** Animate your invaders to float gently in space. Consider using keyframes to create a simple vertical movement.
5. **Customize Your Armada:** Experiment with colors, sizes, and animation timings to make your scene unique. How many invaders can you display? How complex can their animations get?

### Guidelines:

- **Keep It Simple:** Start with basic shapes for your invaders. Complexity can come later with enhancements.
- **Be Creative:** There's more than one way to create an invader. Experiment with CSS properties to find your style.
- **Focus on CSS:** This challenge is about mastering CSS. HTML should be as minimal as possible.
- **Experiment:** Try different animations, shapes, and layouts. What happens if you change the timing or direction of an animation?
