

Complex CSS Border

Objective

Use CSS to design a content box with a multi-layered decorative border.

Instructions

1. Setup

- Create an HTML file with the basic structure (doctype, html, head, body).
- Add a `div` with a class `decorative-border` in the body to serve as your content box.

2. CSS Styling

- Apply styles directly within a `<style>` tag in the head section.
- Style the `body` to center content both vertically and horizontally.
- Give the `.decorative-border` class a solid border, background color, padding, and border-radius for rounded corners. Use box-shadow for depth.

3. Enhancing Border with Pseudo-Elements

- Use `::before` and `::after` pseudo-elements of `.decorative-border` for additional effects:
 - `::before`: Apply an inset box shadow for an inner glow effect.
 - `::after`: Create decorative corners with a dotted border and adjust positioning to sit outside the main box.

4. Adjustments

- Fine-tune colors, borders, and shadows to achieve your desired design.

- Experiment with content inside your `.decorative-border` div to test the design's versatility.
